

CRYPTOT

CRYPTOT CONFLUENCE USER GUIDE

Five readings. One score. No hype.

The complete guide to reading and using the CryptoT Confluence indicator on
TradingView.

"Never quit learning."

EDUCATIONAL ONLY - NOT FINANCIAL ADVICE.

This guide teaches you how to read an indicator. It does not tell you what to buy, sell, or hold.

Crypto assets are volatile and risky. Never invest money you cannot afford to lose.

CONTENTS

This guide is the complete user manual for CryptoT Confluence v1.1.

1 What CryptoT Confluence is

Most indicators shout BUY and SELL all day long. CryptoT Confluence does the opposite: it stays quiet until five independent technical readings - trend, market structure, momentum, money flow and volume - actually agree. When they do, you see it in one number: the Confluence Score, X out of 5, displayed on your chart at all times.

The indicator was built for learners who want to read a chart the way experienced analysts do: structure first, momentum second, confirmation before action. It never fires a signal against the dominant trend, and most days its most useful message is the honest one: not yet.

What this guide does

This guide teaches you the complete method: how to install the indicator, how to read the score and every component, what the qualified signals (CONF, REBOND, CAPITULATION) really mean, what our published historical audit measured - including the contexts to avoid - and how to practise with worked examples before you ever act on a reading.

One thing this guide does NOT include

This guide is education about the method. It does not include access to the indicator itself, it does not reserve access, and it does not promise future access. When access opens, it will be sold exclusively through the TradingView Marketplace.

The Power 5

CryptoT Confluence was built and tested on the CryptoT Power 5 - Bitcoin (BTC), Ethereum (ETH), Cardano (ADA), Solana (SOL) and XRP. Those are the markets used in the audit (Chapter 7) and in the examples (Chapter 10). The indicator technically runs on any TradingView chart; use it elsewhere at your own judgement.

2 Installation on TradingView

Installation takes about 3 minutes, once access is open on the TradingView Marketplace:

- Access is granted by TradingView itself, through the TradingView Marketplace - when your Marketplace subscription is active, the indicator is unlocked for the TradingView account you subscribed with. No username to send us, nothing to sync on our side. (Status: the script is published as invite-only and Marketplace eligibility is in progress - until access opens there, this guide is your way to learn the method.)
- Open TradingView and open any chart (start with ADA/USDT or your favourite Power 5 coin).
- Click Indicators at the top of the chart.
- In the menu on the left, click Invite-only scripts.
- Click CryptoT Confluence. It appears on your chart, with the score panel visible.
- (Optional) Click the star next to the indicator name to keep it in your favourites.

Good to know

The indicator works on any TradingView plan, including the free plan, and on any symbol and timeframe. It uses ONE indicator slot: trend, structure, momentum, flow, volume, the regime layer and the score panel all live inside the single script.

3 Reading the score (X / 5)

The panel shows two scores: the bullish score and the bearish score, each out of 5, plus the state of every component and the regime line (price vs. the EMA 200).

The panel, top-right of your chart.

Two scores out of 5: bullish and bearish.

Each component votes, or stays neutral.

The regime line: price vs. the EMA 200.

Score	Meaning	Suggested posture
0-2 / 5	Noise. The readings disagree or are mostly neutral.	Do nothing. This is most of the time - and it's the point.
3 / 5	Partial alignment. Worth watching.	Observe. Check the automatic support/resistance levels nearby.
4-5 / 5	Strong alignment. The only zone where a signal can appear.	A signal may fire (Chapter 5) - still your decision, with your own risk plan.

Read both scores together. A bullish 4/5 against a bearish 0/5 is a clean alignment. A bullish 3/5 against a bearish 3/5 is a fight - the chart is telling you the readings themselves are split, and the correct trade is usually patience.

4 The five components

C1 - Trend

Price vs. the fast and slow EMAs. Bullish vote only if price is above the slow EMA and the fast EMA is above the slow EMA (mirror for bearish). C1 is also the hard filter: no buy signal can fire below the slow EMA. This is the 'trampoline / ceiling' idea: the moving averages act as a floor or a ceiling depending on the regime, and we never take a signal against the dominant trend.

C2 - Structure

The sequence of confirmed pivot highs and lows. Higher highs + higher lows = bullish structure; lower highs + lower lows = bearish structure. C2 also draws the automatic support/resistance levels - the lines extending to the right of the chart - computed from those same pivots, never hand-drawn.

C3 - Momentum

RSI (above/below 50) and the MACD histogram (its sign) must agree to vote. One alone is not enough. Momentum confirms; it does not predict.

C4 - Flow

A composite (-100 to +100) of three public, published formulas: money flow (MFI), recentered RSI and a recentered stochastic. It asks one question: is money actually behind this move? Positive = flow leans bullish; negative = bearish.

C5 - Volume (RVOL)

Current volume vs. its moving average. C5 has no direction of its own: it gives its point to the leading side only if RVOL is at least 1.2 (real participation). A move without volume does not earn the point.

5 The qualified signals

A full signal needs four things at once: a score of at least 4/5, an opposing score of at most 1/5, the price on the right side of the slow EMA (the C1 hard filter), and the score entering the zone. But in version 1.1, that is not the end of the story: every alignment is then qualified by the long-term regime - the price vs. the EMA 200.

Alignment	Regime (vs. EMA 200)	Label on the chart
BUY alignment	Price ABOVE the EMA 200	CONF - full signal
BUY alignment	Price BELOW the EMA 200	REBOND - observation only
SELL alignment	Price ABOVE the EMA 200 (early breakdown)	CONF - full signal
SELL alignment	Price BELOW the EMA 200 (established downtrend)	CAPITULATION - avoid

CONF - the full signal

The only label that is a signal. A green triangle under the bar (buy alignment) or a red triangle above the bar (sell/exit alignment), with the score in the label (for example CONF 4/5). These are exactly the two contexts our audit found sensible behaviour in (Chapter 7): trend-side alignment on the daily timeframe.

REBOND - observation, NOT a buy signal

Buy-side alignment while price is still below the EMA 200: a counter-trend bounce. The label is amber on purpose. Historically, these bounces had negative median outcomes - buying them as if they were CONF signals is the classic trap (Chapter 8). The correct posture is to watch: a bounce that reclaims the EMA 200 changes regime; until then, it is information, not an invitation.

CAPITULATION - a warning, NOT a sell signal

Full bearish alignment inside an established downtrend. Late selling there historically meant standing in front of rebounds - exhaustion, not continuation. The label exists so you do NOT

sell into it. Patience, or protection sized in advance - never a panic exit at the label.

The anti-echo cooldown

After each full signal, a 10-bar cooldown per direction suppresses repeat 'echo' signals of the same move (a 5/5 score can bypass it). In the audit replay, about 70% of raw signals were echoes of a move already signalled; the cooldown cut that to roughly 45% without touching the proven contexts. REBOND and CAPITULATION labels fire on crossing only - they are context markers, not signals, and have no cooldown.

6 What a signal means - and what it does NOT

When a CONF signal appears, it means exactly this: 'Four or more independent readings just aligned, with participation, in the direction of the dominant trend, inside the regime context the audit supports.' Nothing more.

A signal does NOT mean:

- 'The price will go up/down.' It measures alignment, not the future.
- 'Buy/sell now, this size, with this stop.' Position sizing, invalidation and risk are yours - the indicator knows nothing about your portfolio or your plan.
- 'This worked before, so it will work again.' It won't, every time. Signals are rare by design and wrong sometimes by nature.

Built-in alerts (you activate them in TradingView)

- CryptoT Confluence - BUY alignment
- CryptoT Confluence - SELL alignment
- CryptoT Confluence - Bullish regime entered / Bearish regime entered (score crossing into the 4+ zone)

To set one: click the Alert button (clock icon) on your chart, choose CryptoT Confluence as the condition, pick the alert, and save.

7 The audit - what we measured

Before publishing, we replayed the indicator's exact live rules on public OKX history - the Power 5 coins, daily data from February 2022 to October 2026, plus the 4H timeframe - on confirmed candle closes only (no repainting). Version 1.1 produced 1,820 signal events; after removing the echo repeats with the cooldown, 379 effective full-signal episodes remain. Here is what the numbers say, unedited.

Proven context 1 - full BUY, daily, price above the EMA 200

154 signals. Median outcome at 10 bars: +1.15%. Average at 20 bars: +5.70%. 52% of signals positive. This is the CONF buy context - the strongest cell the audit found, and it is a daily-timeframe context, not a timing trick.

Proven context 2 - full SELL, daily, early breakdown above the EMA 200

86 signals. Median outcome at 20 bars: +1.61% (direction-adjusted), with the favourable move arriving first 52.3% of the time. Catching an early breakdown while the long-term regime is still up behaved sensibly - selling late, inside an established downtrend, did not.

The honesty part

Pooled across every context, short-term timing is roughly a coin flip: full BUY signals reached +3% before -3% in 44.7% of cases vs. 45.6% adverse-first (random baseline 43.5% favourable). On the 4H timeframe, medians sit near zero. There is no general timing edge in these numbers - the measured value lives in the two daily contexts above, and in knowing which contexts to avoid:

- REBOND labels (buy alignment below the EMA 200, N = 428): median 20-bar outcome -1.35% pooled, -2.81% on the daily timeframe. Hence: observation only.
- CAPITULATION labels on the daily timeframe (N = 272): median worst adverse excursion -11.69%. Selling there meant standing in front of rebounds. Hence: avoid.
- Excursions cut both ways: the median worst adverse excursion after a daily full BUY signal was about -9% over 20 bars. That measured fact is why this guide teaches invalidation sized to the instrument - never a fixed -3% stop.

Past signals say nothing about future results. These statistics describe how this specific tool behaved on one historical period, on five markets - nothing more. We publish them because most indicator sellers never publish an audit at all.

8 The traps

Trap 1 - Treating REBOND as a buy signal

A bounce below the EMA 200 feels like a bargain. Measured: negative medians, worse on the daily timeframe. The amber label is the product doing its job. Watch it; do not marry it.

Trap 2 - Selling into CAPITULATION

Full bearish alignment inside an established downtrend is usually exhaustion, not the start of the fall. The measured median adverse excursion after these labels was -11.69% on the daily timeframe - against the seller. If your plan called for an exit, it should have happened on structure, earlier - not on this label.

Trap 3 - Lowering the threshold to 3/5

It is possible in the settings, and it does produce more signals - mostly more false ones. The 4/5 threshold is where the audit's contexts were measured. Leave it at 4 while you learn.

Trap 4 - Scalping below 1H

The indicator was designed for 4H/1D-style reading. Below 1H you get noise and a low score most of the time - and the audit found no timing edge to harvest there anyway.

Trap 5 - Reading a signal as a promise

Even in the best measured context, the median worst adverse excursion after a full BUY was about -9%. A signal without an invalidation plan is a hope, not a method. Decide - before the signal - where you are wrong, and size the idea to the instrument.

9 Recommended settings by timeframe

The defaults are tuned for learning and swing reading. Start here:

Timeframe	Recommendation
Daily (1D)	Defaults, untouched. The reference timeframe for the method.
4H	Defaults, untouched. The main working timeframe - structure and trend stay readable.
1H	Usable, but expect more noise and a lower score most of the time. Keep the signal threshold at 4.
Below 1H	Not recommended. The indicator was designed for 4H/1D-style reading, not scalping.

General guidance: 1D to decide the direction, 4H to watch the setup. Lowering the signal threshold from 4 to 3 is possible in the settings, but false signals increase - the guide's advice is to leave it at 4 while you learn.

10 Worked examples

Two reading exercises. They are illustrative - a method rehearsal, not real signals and not recommendations. Practise exactly this way on your own charts, after the close.

Example A - ADA, daily: a CONF buy reads itself

- Regime first: the daily close is above the EMA 200, and the EMA 200 rises. Regime line: UP. Any buy alignment here can be a full CONF.
- C1 Trend: price above the slow EMA, fast EMA above the slow EMA. Vote: yes.
- C2 Structure: the last pivots are higher highs and higher lows, and price holds above the last automatic support. Vote: yes.
- C3 Momentum: RSI at 58 (above 50) and the MACD histogram is positive. The two agree. Vote: yes.
- C4 Flow: the composite reads +42. Money leans with the move. Vote: yes.
- C5 Volume: RVOL is 0.9 - below 1.2. No point. The leading side keeps the score at 4/5.
- Result: bullish 4/5, bearish 0/5, regime UP, score entering the zone: the chart prints CONF 4/5. Meaning: alignment, in context - the proven context of Chapter 7. Not a promise: the same audit says the median worst excursion after such signals was about -9%, so the invalidation is planned on structure (a daily close back below the slow EMA / the last higher low), sized to ADA - never a fixed -3%.

Example B - BTC, 4H: a REBOND that stays a REBOND

- Regime first: on the daily timeframe, price is below the EMA 200. Regime: DOWN. Any buy alignment, on any timeframe, is a candidate REBOND - never a CONF.
- On the 4H chart the components light up: trend flips up locally, structure makes a higher low, momentum agrees, flow turns positive, volume participates. Bullish score: 5/5.
- The chart prints the amber REBOND label - observation. Chapter 7 measured what usually follows: pooled median -1.35% at 20 bars, and -2.81% on the daily timeframe.
- Correct posture: no buy. Watch whether the bounce can reclaim the EMA 200 on a daily close - a regime change - and let the 4H setup mature in the meantime. The label did not fail you; it saved you from the most common counter-trend trap in the book.

11 FAQ

How do I get access to the indicator?

Access will be sold only through the TradingView Marketplace, once Creator Program eligibility is complete (script live 3+ months, 100+ boosts, TradingView's review). Until then, no access is sold anywhere - and this guide is how you learn the method in the meantime. Join the launch-notice list on the product page to be told the day it opens.

Does it work on stocks / forex?

Technically it runs on any TradingView chart. It was built and tested for the crypto Power 5 (BTC, ETH, ADA, SOL, XRP). Use it elsewhere at your own judgement.

Why are there so few signals?

By design. A signal requires 4 of 5 independent readings, real volume, and the trend's permission - inside the right regime context. Most days, the honest answer is 'no alignment' - the score shows you that instead of inventing trades.

Can I buy access anywhere else - a website, a DM, for crypto?

No. The only legitimate channel will be the TradingView Marketplace. Anyone offering to sell you access elsewhere is not CryptoT - please report it to us.

Does it guarantee profits?

No - and run from anyone who says their indicator does. It is an educational tool that shows alignment. Your decisions, your risk, your responsibility.

Before you go

CryptoT Confluence measures alignment. It does not predict prices, and it does not guarantee any outcome - no indicator can.

Five readings. One score. The discipline to wait for 'yes' - and the honesty to hear 'not yet'.

Disclaimer

CryptoT Confluence and this guide are published by CryptoT for education and entertainment only. They are not financial, investment, legal or tax advice, and nothing in this guide is a recommendation or solicitation to buy, sell or hold any asset. Cryptocurrency is volatile and high-risk; you can lose some or all of any money you put in. The audit statistics presented in this guide are historical measurements from a defined past period (public OKX data, February 2022 - October 2026 depending on timeframe) and will not repeat as-is. Past performance never guarantees future results. Do your own research and, for decisions that matter, consult a licensed professional in your jurisdiction.
